

Sensory Soother Ball

***Thank you for purchasing the Sensory Soother Ball.
We hope you agree that it will be a great addition to your sensory program.***

Please inflate your Sensory Soother Ball by blowing air into both valve openings (one for the interior space, that also contains the white foam beads, and one for the outer space that surrounds it).

The Sensory Soother Ball can be used just like this for fun toss and catch games that exercise both hand-eye coordination and gross motor skills...or it can be filled with water for a unique sensory experience.

Using a common household drinking straw (not included), insert it into the valve connected with the interior space (the space that also contains the white foam beads). Place the straw under a running faucet and add cool/cold water until the interior space is close to full. Next, we recommend adding several drops of common household white vinegar to the water (not included). Once added, close the valve securely and you are now ready to watch the beads float back and forth as the ball is flipped over creating a wonderfully soothing sensory experience. Once the ball is filled with water, it is no longer recommended for toss and catch games as the weight of the water may damage the ball or create a heavy object that could induce injury.

We recommend draining and changing the water solution every couple of weeks to help prevent bacteria and keep your Sensory Soother Ball in ready-to-use condition at all times.
